EDUCATION

Bachelor of Engineering (Honours), Software Engineering

Macquarie University, Sydney

Feb 2022 – Jun 2027

Degree conferred Sep 2027

Coursework: Data Structures & Algorithms, Distributed Systems, Operating Systems, Computer Networks, Database Systems, Object-Oriented Programming, Cloud Computing, Software Engineering Practices, Embedded Systems, Agile Project Management, Honours Research Thesis

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, Python, C++20, Java, SQL, R, HTML, CSS

Web & frameworks: React, Next.js, Node.js, three.js / WebGL, Canvas, Tailwind CSS, Prisma ORM, REST APIs

Cloud & data: Azure Functions, Supabase, PostgreSQL, Firebase, Redis, Vercel

DevOps & tooling: Git, GitHub, GitHub Actions, Docker, CI/CD pipelines

AI-assisted development: Claude Code, OpenAI Codex, Claude & OpenAI APIs, agentic AI pipelines, prompt design, RAG fundamentals

Practices: Agile, Scrum, test-driven development, requirements engineering, design systems, threat modelling

EXPERIENCE

Research Software Engineer Intern

Apr 2026 – Present

Australian Catholic University, Institute for Positive Psychology and Education · Sydney

- Build and extend a Python service on Azure Functions that renders individual participant PDF reports from longitudinal REDCap survey data, where thousands must come out correct without a human checking each one.
- Set the requirements for a redesigned participant report with the research team, then put a mockup in front of them before writing code, so feedback landed while changes were still cheap.
- Drafting the software requirements and design specifications for the aggregate reporting track, so the build has a document to be checked against rather than a conversation to remember.
- Work under a research ethics protocol that keeps identifiable data off external services, and to a team rule that AI writes either the implementation or the tests but never both.

Technical Lead / IT Director

May 2025 – Present

UTS Bangladeshi Society · Sydney

- Shipped the Graamys awards platform end to end in a two-week sprint: nine categories, a voting flow with duplicate-vote prevention, and an audit trail the committee reviews after each cycle.
- Own the society's Next.js website and internal tooling for roughly 300 members, with a headless CMS so non-technical committee members publish event updates without a developer in the loop.
- Turn what the Events, Marketing and Creative teams ask for into scoped features, holding the line on scope so the codebase does not fill up with work nobody asked for.

Desktop Rollout Engineer

Apr 2026 – Present

Lenovo · Sydney

- Deploy and configure enterprise desktop hardware on a client site in the Sydney CBD, scheduling rollouts with the service team so the business keeps running through the change.
- Provision workstations from standardised images and keep the asset inventory accurate across the client's fleet, tracking every deployment and replacement.
- Triage hardware faults with the service coordinator and write up the resolutions, so the same fault costs the next technician minutes instead of an afternoon.

Sales Consultant

Jul – Dec 2025

Optus · Sydney

- Sold Optus products and services by reviewing each customer's existing account and combining current offers, plans and bundles into something that actually fit what they used.
- Grew accounts through consultative upsell and cross-sell on inbound interactions, consistently beating shift targets.

PROJECTS

DynamicFit · 3D bin-packing solver with a browser visualiser

[C++20](#) · [three.js / WebGL](#) · [JavaScript](#) · [JSON Schema](#) · [React](#)

- Three-dimensional bin packing, an NP-hard problem, solved in C++20 and handed back to the user as a real-time three.js scene the browser paints on a WebGL canvas.
- Designed the JSON-Schema contract two other teams built against before the solver existed, then pinned it with 11 render fixtures over 7 invariants so a solver change cannot silently break the 3D view.
- Wrote the adapter mapping solver output into the visualiser's view model, plus the portal's solve routes, so three teams could work in parallel instead of waiting on each other.

AutoDocs · AI documentation pipeline for TypeScript projects

[TypeScript](#) · [AST analysis](#) · [GitHub Actions](#) · [Docker](#) · [OpenAI API](#)

- CI pipeline that parses TypeScript source into an AST, prompts a model from the structure it finds, and validates every response against a JSON schema before it lands, retrying when it does not.
- Incremental processing and token-aware chunking re-document only changed files per commit, which is what makes it cheap enough to run on every push.

Korvo · agentic job-outreach platform

[Next.js](#) · [TypeScript](#) · [Supabase](#) · [Claude API](#) · [BullMQ](#) · [Redis](#) · [Stripe](#) · [Gmail API](#)

- Four Claude agents run as a BullMQ DAG: a contact finder, an email guesser and a research agent feed a drafter, with the two middle agents in parallel before the drafter consolidates their output.
- Row-level security for per-user data isolation, Stripe subscriptions, and Gmail OAuth so paying users send from their own inbox, with Kanban tracking through identified, contacted and responded.

Bridge Opening System · engineering capstone, scale-model drawbridge

[C++](#) · [ESP32](#) · [Arduino](#) · [real-time control](#)

- Wrote the control logic coordinating six sensors and four actuators across two microcontrollers, polling sensors and driving motors in real time.
- Built the safety layer: collision detection, positional limit enforcement, weight-based load sensing and an emergency stop, all inside the project's real-time response budget.
- Owned the whole software side alongside mechanical and electrical engineering students, working through sensor placement, wiring decisions and end-to-end integration testing together.

DecisionLog · architecture decision record tracker

[Next.js](#) · [TypeScript](#) · [Supabase](#) · [Prisma](#) · [Tailwind](#)

- Full-stack tool for tracking architecture decisions with version history, stakeholder tagging and impact assessments, built for the problem of teams losing the reasoning when people rotate off.
- Full-text search with fuzzy matching and filters, so a past decision surfaces in seconds instead of an archaeology dig through old documents and Slack threads.

GearBoxStudio · UI component library and design system

[Next.js](#) · [TypeScript](#) · [Supabase](#) · [Prisma](#) · [Tailwind](#)

- Base primitives and a layered component hierarchy, so a new page layout comes together without duplicating styles across the codebase.
- Supabase backend with Prisma on the data layer, OAuth for authentication, and real-time subscriptions so connected clients see changes without a manual refresh.

CERTIFICATIONS

[Google Data Analytics Professional Certificate](#) · [IBM Cloud Computing Certificate](#)
